LELAND STANFORD JUNIOR UNIVERSITY

DEPARTMENT OF BOTANY

Stanford University, Cal.,
May 18, 1922.

Dear Professor Munz:

The onions Johnston sent up are as follows according to my understanding of the species:

#5051 Allium parryi The distribution of this according to our specimens is from Laguna, San Diego County to San Benito County. We have a specimen from the " plains between Victorville and Rabbit Springs.

✓2801 Allium fimbriatum

✓2802 Allium lacunosum. This is the same as the Victorville plants which Jones named davisae. Jones had no bulbs, and Parish's specimens collected later at what I understand is the type station, have no bulbs, but your specimens confirm my conclusions that davisae is identical with lacunosum.

Johnston did not say whether the specimens are duplicates, but I am keeping them with the assumption that you will write if they are not. Very truly yours L.R. Abrams

✓5106 Muilla maritima - Johnston from San Diego Co.,
